

DURATION

The duration of a Cognitive Rehabilitation Program ranges from 4 – 9 months. After the completion of the program, we conduct a neuropsychological assessment which is compared with the initial assessment to determine the effectiveness of the intervention and see how we will proceed.

To be effective, a Cognitive Rehabilitation Program should be repeated 2-5 times/week, which is often difficult for patients. This obstacle can be overcome by modern technology. We offer the possibility to patients, after having become familiar with the process, to receive Cognitive Rehabilitation exercises by e-mail. Under the therapist's close supervision and with their own personal commitment, the patients can benefit from a structured Cognitive Rehabilitation program in the comfort of their house.
